# Glassplate

### Pushing the limits!

As the go-to provider of composite wear plates, Welding Alloys Integra $^{\text{TM}}$  has developed a welded overlay plate dedicated to applications in the glass industry.

Glass*plate* has a unique market position. It contains less than 0.05% nickel which reduces the risk of nickel contamination in the glass product itself.

### **Features**

- Specific development of a highchromium cast iron with low nickel content compared to quenched & tempered steels
- Total nickel content less than 0.05%
- High chromium carbide content resulting in substantially increased wear resistance
- Typical hardness of 58 64 HRC
- Stringer bead welding

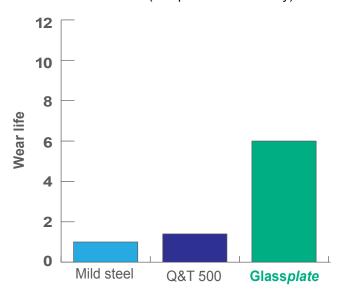

#### **Benefits**

- Reduced risk of nickel sulfide (NiS) formation, hence reducing spontaneous glass failure
- Increased safety, especially in the building industry
- Outstanding abrasion resistance
- High corrosion and oxidation resistance

### **Outstanding abrasion resistance**

ASTM G-65 Wear Test (independent laboratory)

#### Glassplate

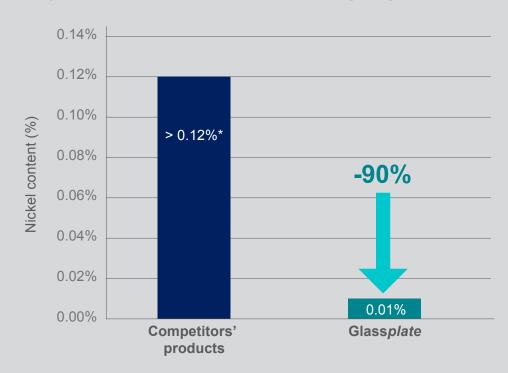

Standard dimensions: 1400 x 2900mm 1900 x 2900mm

Standard thickness: 5 – 15mm

The results compare the wear life of various products tested. Glass*plate* has outlasted 500 BHN quenched and tempered material by a factor of 4.

## Product

### Very low nickel content for stronger glass!

Very low Nickel content considerably reduces the risk of nickel sulfide (NiS) formation which provides stronger glass with a lower risk of spontaneous glass failure.

<sup>\*</sup> Results obtained from measurements taken from various samples
